

Dear Primary Engineer Specialist,

Have you ever suffered from blindness? If so, keep on reading.

My invention - which is glasses for the blind - help blind people be able to go places again.

This design helps them because the glasses have cameras that send connections to the sensor on the hot and cold vibration stick. If you go near something the vibration stick will go hot giving a signal to walk away. Once you have done that, the vibration stick will stop vibrating and will go back to normal temperature.

I was inspired by seeing those who face difficulties.

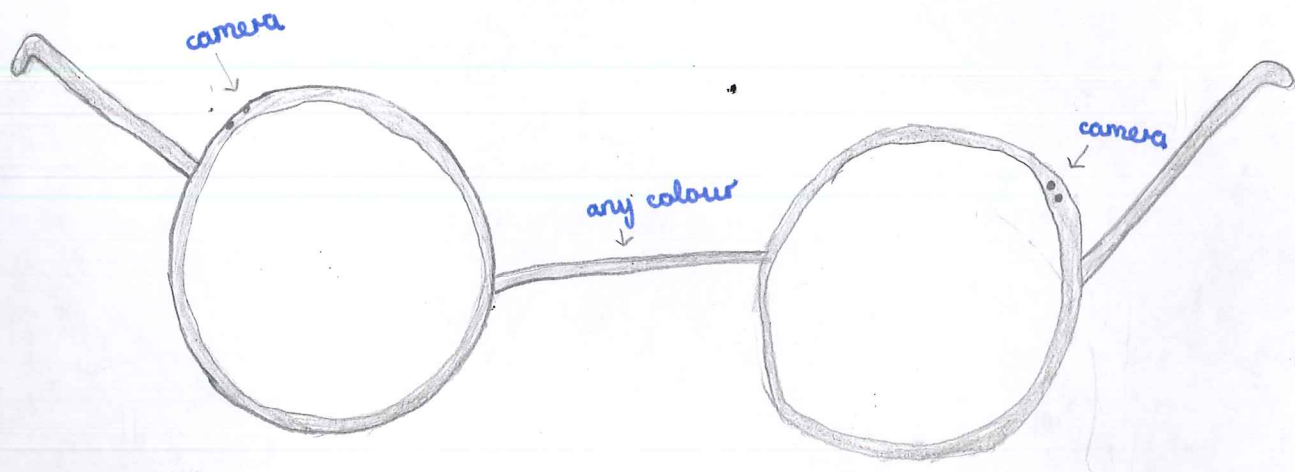

I think you should make this design because so many people suffer from blindness and this invention will make blind people more confident to go different places.

Please select my design because it will help a lot of people who struggle with every day challenges.

Yours sincerely,

Lily Slade

Glasses for the blind

When you drop the hot and cold vibration stick it gives out a big noise so you know where it is.
